Not illustrated. 1917 Excerpt: . . . data and results, H--- ar, d H--!-H indicate syphilis, stronglv suggestive;-)-suggestive; and J slightly suggestive. Babies, who remained well, remained so up to time of discharge from the Hospital, usually at the sixth week. Subsequent condition could not be followed. It will be seen from the table that although the spirochetes were readily demonstrated in the controls, in no case could they be found in suspected cord or placental tissue on repeated examinations. In two of the cases the fetal liver was found to contain numerous organisms, easily demonstrated. In view of these results it would seem to be futile to attempt to diagnose syphilis by the demonstration of spirochetes in the placenta by the Levaditi method. The examination of the fetal liver in a suspected case, coming to autopsy, offers a much greater chance of success, and should be made use of as a practical method. REFERENCES. 1. Bartholomew, R. A. Bottsford: I havent anything to add to Dr. Bartholomews paper from the microscopic standpoint. According to most men the placenta offers a macroscopic diagnosis of lues; that is, a typical syphilitic placenta is supposed to be much larger and heavier...
